Moment generating functions - the interval

$\mu_m^\rho := \int_P \mathbf{x}^m \rho(\mathbf{x}) d\mathbf{x}$ — the $\mathbb{Z}_+ \ni m$ -th moment of ρ supported on $P \subset \mathbb{R}^d$. What is a “natural” generating function to encode μ_m^ρ 's?

Moment generating functions - the interval

$\mu_m^\rho := \int_P \mathbf{x}^m \rho(\mathbf{x}) d\mathbf{x}$ — the $\mathbb{Z}_+ \ni m$ -th moment of ρ supported on $P \subset \mathbb{R}^d$. What is a “natural” generating function to encode μ_m^ρ 's?

Try Cauchy transform

$$F(u) = \int_P \frac{\rho(x) dx}{1 - \langle u, x \rangle} = \sum_{k \geq 0} \int_P \langle u, x \rangle^k \rho(x) dx = \sum_m \binom{|m|}{m} \mu_m^\rho u^m.$$

Moment generating functions - the interval

$\mu_m^\rho := \int_P \mathbf{x}^m \rho(\mathbf{x}) d\mathbf{x}$ — the $\mathbb{Z}_+ \ni m$ -th moment of ρ supported on $P \subset \mathbb{R}^d$. What is a “natural” generating function to encode μ_m^ρ 's?

Try Cauchy transform

$$F(u) = \int_P \frac{\rho(x) dx}{1 - \langle u, x \rangle} = \sum_{k \geq 0} \int_P \langle u, x \rangle^k \rho(x) dx = \sum_m \binom{|m|}{m} \mu_m^\rho u^m.$$

Already for $\rho \equiv 1$ and $d = 1$: $F(u) = \int_a^b \frac{dx}{1-ux}$ we get a transcendental function.

Moment generating functions - the interval

$\mu_m^\rho := \int_P \mathbf{x}^m \rho(\mathbf{x}) d\mathbf{x}$ — the $\mathbb{Z}_+ \ni m$ -th moment of ρ supported on $P \subset \mathbb{R}^d$. What is a “natural” generating function to encode μ_m^ρ 's?

Try Cauchy transform

$$F(u) = \int_P \frac{\rho(x) dx}{1 - \langle u, x \rangle} = \sum_{k \geq 0} \int_P \langle u, x \rangle^k \rho(x) dx = \sum_m \binom{|m|}{m} \mu_m^\rho u^m.$$

Already for $\rho \equiv 1$ and $d = 1$: $F(u) = \int_a^b \frac{dx}{1-ux}$ we get a transcendental function. Much better would be to do

$$\int_a^b \frac{dx}{(1-ux)^2} = \frac{|a-b|}{(1-au)(1-bu)}.$$

Moment generating functions - the interval

$\mu_m^\rho := \int_P \mathbf{x}^m \rho(\mathbf{x}) d\mathbf{x}$ — the $\mathbb{Z}_+ \ni m$ -th moment of ρ supported on $P \subset \mathbb{R}^d$. What is a “natural” generating function to encode μ_m^ρ 's?

Try Cauchy transform

$$F(u) = \int_P \frac{\rho(x) dx}{1 - \langle u, x \rangle} = \sum_{k \geq 0} \int_P \langle u, x \rangle^k \rho(x) dx = \sum_m \binom{|m|}{m} \mu_m^\rho u^m.$$

Already for $\rho \equiv 1$ and $d = 1$: $F(u) = \int_a^b \frac{dx}{1-ux}$ we get a transcendental function. Much better would be to do

$$\int_a^b \frac{dx}{(1-ux)^2} = \frac{|a-b|}{(1-au)(1-bu)}. \quad \text{How does it relate to } F(u)?$$

Differentiate!

Moment generating functions - the interval

 - Fantappié moment matrices?

Fantappiè transformations, $\rho \equiv 1$

Let $F(u) = \int_P \frac{dx}{1-\langle u, x \rangle} = \sum_m \binom{|m|}{m} \mu_m u^m$, and
 $g(z) := g(z_1, \dots, z_d) = \prod_{\ell=1}^d (\sum_k z_k + \ell)$.

Fantappiè transformations, $\rho \equiv 1$

Let $F(u) = \int_P \frac{dx}{1 - \langle u, x \rangle} = \sum_m \binom{|m|}{m} \mu_m u^m$, and
 $g(z) := g(z_1, \dots, z_d) = \prod_{\ell=1}^d (\sum_k z_k + \ell)$.

Definition

Fantappiè transformation (“rationalized” moment generating function) of $P \subset \mathbb{R}^d$ is

$$\begin{aligned} \mathcal{F}_P(u) &:= g\left(u_1 \frac{\partial}{\partial u_1}, \dots, u_d \frac{\partial}{\partial u_d}\right) \circ F(u) \\ &= \int_P \frac{d! dx}{(1 - \langle u, x \rangle)^{d+1}} = \sum_m \frac{(|m| + d)!}{\prod_j m_j!} \mu_m u^m. \end{aligned}$$

Fantappiè transformation of a simplex

Example

Fantappiè transformation (“rationalized” moment generating function) of a simplex $\Delta = \text{conv}(v_1, \dots, v_{d+1}) \subset \mathbb{R}^d$ is

$$\mathcal{F}_\Delta(u) = \int_\Delta \frac{d! dx}{(1 - \langle u, x \rangle)^{d+1}} = \frac{d! \text{Vol}(\Delta)}{\prod_k (1 - \langle v_k, u \rangle)}.$$

Fantappiè transformation of a simplex

Example

Fantappiè transformation (“rationalized” moment generating function) of a simplex $\Delta = \text{conv}(v_1, \dots, v_{d+1}) \subset \mathbb{R}^d$ is

$$\mathcal{F}_\Delta(u) = \int_\Delta \frac{d! dx}{(1 - \langle u, x \rangle)^{d+1}} = \frac{d! \text{Vol}(\Delta)}{\prod_k (1 - \langle v_k, u \rangle)}.$$

This is known to be true in greater generality (\mathbb{C} -convexity), when Δ is a simplex in $\mathbb{C}P^{d-1}$. Cf. e.g. Andersson-Passare-Sigurdsson (2004).

Fantappiè valuation, $\rho \equiv 1$

Corollary

Let $P \subset \mathbb{R}^d$ be a (non-convex) polytope, i.e. finite union of convex polytopes.

Fantappiè valuation, $\rho \equiv 1$

Corollary

Let $P \subset \mathbb{R}^d$ be a (non-convex) polytope, i.e. finite union of convex polytopes. Then its Fantappiè transformation $\mathcal{F}_P(u)$ is a rational function with denominator dividing $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Fantappiè valuation, $\rho \equiv 1$

Corollary

Let $P \subset \mathbb{R}^d$ be a (non-convex) polytope, i.e. finite union of convex polytopes. Then its Fantappiè transformation $\mathcal{F}_P(u)$ is a rational function with denominator dividing $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Thus we got a valuation

Fantappiè valuation, $\rho \equiv 1$

Corollary

Let $P \subset \mathbb{R}^d$ be a (non-convex) polytope, i.e. finite union of convex polytopes. Then its Fantappiè transformation $\mathcal{F}_P(u)$ is a rational function with denominator dividing $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Thus we got a valuation (a bit mysterious to us now)

constant measures supp. on $\mathcal{P}(\mathbb{R}^d) \rightarrow$ rational functions on \mathbb{R}^d

on the algebra $\mathcal{P}(\mathbb{R}^d)$ of polyhedra.

Fantappiè valuation, $\rho \equiv 1$

Corollary

Let $P \subset \mathbb{R}^d$ be a (non-convex) polytope, i.e. finite union of convex polytopes. Then its Fantappiè transformation $\mathcal{F}_P(u)$ is a rational function with denominator dividing $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Thus we got a valuation (a bit mysterious to us now)

constant measures supp. on $\mathcal{P}(\mathbb{R}^d) \rightarrow$ rational functions on \mathbb{R}^d

on the algebra $\mathcal{P}(\mathbb{R}^d)$ of polyhedra. Cf.

Brion-Barvinok-Khovanskii-Lawrence -Pukhlikov

$\mathcal{P}(\mathbb{R}^d) \rightarrow$ meromorphic functions on \mathbb{R}^d

$$P \mapsto \int_P e^{\langle u, x \rangle} dx$$

Formulae for Fantappiè transformations, $\rho \equiv 1$

Theorem

The Fantappiè transformation of a simple polytope $P \subset \mathbb{R}^d$ is

$$\begin{aligned} \mathcal{F}_P(u) &= (-1)^d \sum_{v \in V(P)} \frac{\begin{vmatrix} w_1(v) - v \\ \vdots \\ w_d(v) - v \end{vmatrix}}{\prod_{j=1}^d \langle w_j(v), u \rangle} \cdot \frac{1}{1 - \langle v, u \rangle} \\ &= (-1)^d \sum_{v \in V(P)} \langle v, u \rangle^d \begin{vmatrix} w_1(v) - v \\ \vdots \\ w_d(v) - v \end{vmatrix} \prod_{j=1}^d \langle w_j(v), u \rangle^{-1} \cdot \frac{1}{1 - \langle v, u \rangle} \end{aligned}$$

where $w_1(v), \dots, w_d(v)$ are generators of the vertex cone of $v \in V(P)$.

Vertices of compact non-convex polyhedra

As we saw, the denominator of $\mathcal{F}_P(u)$ divides $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Vertices of compact non-convex polyhedra

As we saw, the denominator of $\mathcal{F}_P(u)$ divides $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Definition

A *dissection* of P is a finite collection \mathcal{T} of d -simplices $T_i = \text{conv}(v_{i0}, \dots, v_{id})$ s.t, $\text{int } T_i \cap \text{int } T_j = \emptyset$, $i \neq j$, and $P = \cup_j T_j$.

Vertices of compact non-convex polyhedra

As we saw, the denominator of $\mathcal{F}_P(u)$ divides $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Definition

A *dissection* of P is a finite collection \mathcal{T} of d -simplices $T_i = \text{conv}(v_{i0}, \dots, v_{id})$ s.t, $\text{int } T_i \cap \text{int } T_j = \emptyset$, $i \neq j$, and $P = \cup_i T_i$. (note that triangulations are particular types of dissections).

Vertices of compact non-convex polyhedra

As we saw, the denominator of $\mathcal{F}_P(u)$ divides $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Definition

A *dissection* of P is a finite collection \mathcal{T} of d -simplices $T_i = \text{conv}(v_{i0}, \dots, v_{id})$ s.t. $\text{int } T_i \cap \text{int } T_j = \emptyset$, $i \neq j$, and $P = \cup_i T_i$. (note that triangulations are particular types of dissections). Its vertices: $V(\mathcal{T}) = \cup_i \{v_{i0}, \dots, v_{id}\}$.

Vertices of compact non-convex polyhedra

As we saw, the denominator of $\mathcal{F}_P(u)$ divides $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Definition

A *dissection* of P is a finite collection \mathcal{T} of d -simplices $T_i = \text{conv}(v_{i0}, \dots, v_{id})$ s.t. $\text{int } T_i \cap \text{int } T_j = \emptyset$, $i \neq j$, and $P = \cup_i T_i$. (note that triangulations are particular types of dissections). Its vertices: $V(\mathcal{T}) = \cup_i \{v_{i0}, \dots, v_{id}\}$. Define the set $V(P)$ of *vertices* of P

$$V(P) := \bigcap_{\mathcal{T} \text{ is a dissection of } P} V(\mathcal{T})$$

Vertices of compact non-convex polyhedra

As we saw, the denominator of $\mathcal{F}_P(u)$ divides $\prod_{v \in V} (1 - \langle v, u \rangle)$, where V is the set of vertices of a triangulation of P .

Definition

A *dissection* of P is a finite collection \mathcal{T} of d -simplices $T_i = \text{conv}(v_{i0}, \dots, v_{id})$ s.t. $\text{int } T_i \cap \text{int } T_j = \emptyset$, $i \neq j$, and $P = \cup_i T_i$. (note that triangulations are particular types of dissections). Its vertices: $V(\mathcal{T}) = \cup_i \{v_{i0}, \dots, v_{id}\}$. Define the set $V(P)$ of *vertices* of P

$$V(P) := \bigcap_{\mathcal{T} \text{ is a dissection of } P} V(\mathcal{T})$$

Then we can take $V := V(P)$. (For P convex it's the usual vertices.) More details here: [Gravin-DP-B.&M.Shapiro \(2012\)](#)

Parametrizing P by simplices from $V(P)$

Theorem

Assume that any $d + 2$ points in $V(P)$ affinely span \mathbb{R}^d (non-degeneracy). Then the constant unit density measure $[P]$ supported on P satisfies

$$[P] = \sum_{\{v_0, \dots, v_d\} \subset V(P)} a_{v_0 \dots v_d} [\text{conv}(v_0, \dots, v_d)]. \quad (1)$$

Parametrizing P by simplices from $V(P)$

Theorem

Assume that any $d + 2$ points in $V(P)$ affinely span \mathbb{R}^d (non-degeneracy). Then the constant unit density measure $[P]$ supported on P satisfies

$$[P] = \sum_{\{v_0, \dots, v_d\} \subset V(P)} a_{v_0 \dots v_d} [\text{conv}(v_0, \dots, v_d)]. \quad (1)$$

Conjecturally, the assumption above is not needed.

Parametrizing P by simplices from $V(P)$

Theorem

$$[P] = \sum_{\{v_0, \dots, v_d\} \subset V(P)} a_{v_0 \dots v_d} [\text{conv}(v_0, \dots, v_d)]. \quad (1)$$

Conjecturally, the assumption above is not needed.

Why is (1) nontrivial? Cause often extra vertices are needed to dissect non-convex polytopes.

Parametrizing P by simplices from $V(P)$

Theorem

Assume that any $d + 2$ points in $V(P)$ affinely span \mathbb{R}^d (non-degeneracy). Then the constant unit density measure $[P]$ supported on P satisfies

$$[P] = \sum_{\{v_0, \dots, v_d\} \subset V(P)} a_{v_0 \dots v_d} [\text{conv}(v_0, \dots, v_d)]. \quad (1)$$

Conjecturally, the assumption above is not needed.

Why is (1) nontrivial? Cause often extra vertices are needed to dissect non-convex polytopes. An example is *Schönhardt polyhedron*.

Schönhardt polyhedron

Schönhardt polyhedron

To dissect, it needs an extra vertex in the interior.

A glimpse of the proof

Apply Fantappiè transformation to both sides of (1)

$$\begin{aligned} \mathcal{F}_P(u) &= \frac{P(u)}{\prod_{v \in P(V)} (1 - \langle u, v \rangle)} \\ &\stackrel{(\text{??})}{=} \sum_{\Omega := \{v_0, \dots, v_d\} \subset V(P)} a_\Omega \frac{\text{Vol}(\text{conv}(\Omega))}{\prod_{v \in \Omega} (1 - \langle u, v \rangle)}. \end{aligned}$$

We would be done if we manage to show that $P(u)$ lies in the vectorspace Π spanned by the products $\Pi_\Omega = \frac{\prod_{v \in P(V)} (1 - \langle u, v \rangle)}{\prod_{v \in \Omega} (1 - \langle u, v \rangle)}$, where $\Omega := \{v_0, \dots, v_d\} \subset V(P)$.

Non-degeneracy implies that Π_Ω , s.t. $v_0 \in \Omega$, span Π .

A bit of commutative algebra shows that $\dim \Pi$ coincides with the dimension of full the space of polynomials in u of the appropriate degree, and the latter spanning set is a basis.

A glimpse of the proof

Apply Fantappiè transformation to both sides of (1)

$$\begin{aligned}\mathcal{F}_P(u) &= \frac{P(u)}{\prod_{v \in P(V)} (1 - \langle u, v \rangle)} \\ &\stackrel{(\text{??})}{=} \sum_{\Omega := \{v_0, \dots, v_d\} \subset V(P)} a_\Omega \frac{\text{Vol}(\text{conv}(\Omega))}{\prod_{v \in \Omega} (1 - \langle u, v \rangle)}.\end{aligned}$$

 - Fantappiè moment matrices?

Axial moments

Specialize to axial moments: pick several $\mathbf{z} \in \mathbb{R}^d$, and consider

$$\mu_j(\mathbf{z}) = \int_P \langle x, \mathbf{z} \rangle^j \rho(x) dx$$

Axial moments

Specialize to axial moments: pick several $\mathbf{z} \in \mathbb{R}^d$, and consider

$$\mu_j(\mathbf{z}) = \int_P \langle x, \mathbf{z} \rangle^j \rho(x) dx$$

recover univariate rational generating functions

$$\Phi_{\mathbf{z}}(t) = \sum_j \frac{(j+d)!}{j!} \mu_j(\mathbf{z}) t^j = \sum_j c_j t^j.$$

Axial moments

Specialize to axial moments: pick several $\mathbf{z} \in \mathbb{R}^d$, and consider

$$\mu_j(\mathbf{z}) = \int_P \langle x, \mathbf{z} \rangle^j \rho(x) dx$$

recover univariate rational generating functions

$$\Phi_{\mathbf{z}}(t) = \sum_j \frac{(j+d)!}{j!} \mu_j(\mathbf{z}) t^j = \sum_j c_j t^j.$$

Reconstruct P , by finding the kernel of the (infinite) Hankel matrix $H = (c_{i+j})_{0 \leq i, j < \infty}$ from found, as denominators of $\Phi_{\mathbf{z}}(t)$, projections of $v \in \text{Vert}(P)$ to \mathbf{z} . Use a variation of Prony method to solve the underlying nonlinear system.

Fantappié moment matrices

Let $\mathcal{F}_P(u) = \sum_I c_I u^I$, and $A = (c_{I+J})_{I,J}$, for a nice ordering of the monomial basis $B = \{1, u^{l_1}, u^{l_2}, \dots\}$.

Fantappié moment matrices

Let $\mathcal{F}_P(u) = \sum_I c_I u^I$, and $A = (c_{I+J})_{I,J}$, for a nice ordering of the monomial basis $B = \{1, u^{l_1}, u^{l_2}, \dots\}$.

When P is a polyhedron, $\mathcal{F}_P(u) = p(u)/q(u)$ is rational, and thus A has a kernel, although A is not of finite rank.

Fantappié moment matrices

Let $\mathcal{F}_P(u) = \sum_I c_I u^I$, and $A = (c_{I+J})_{I,J}$, for a nice ordering of the monomial basis $B = \{1, u^{l_1}, u^{l_2}, \dots\}$.

When P is a polyhedron, $\mathcal{F}_P(u) = p(u)/q(u)$ is rational, and thus A has a kernel, although A is not of finite rank.

Lemma

$c \in \text{Ker } A$ iff for any u^K the Laurent series $u^{-K} \mathcal{F}_P(u) \sum_I c_I u^{-I}$ has no free term.

Fantappié moment matrices

Let $\mathcal{F}_P(u) = \sum_I c_I u^I$, and $A = (c_{I+J})_{I,J}$, for a nice ordering of the monomial basis $B = \{1, u^{I_1}, u^{I_2}, \dots\}$.

When P is a polyhedron, $\mathcal{F}_P(u) = p(u)/q(u)$ is rational, and thus A has a kernel, although A is not of finite rank.

Lemma

$c \in \text{Ker } A$ iff for any u^K the Laurent series $u^{-K} \mathcal{F}_P(u) \sum_I c_I u^{-I}$ has no free term.

Corollary

Let $\sum_I c_I u^I = u^M q(\frac{1}{u_1}, \dots, \frac{1}{u_d}) \in \mathbb{R}[u]$, and u^M does not divide any monomial of $p(u)$. Then $c \in \text{Ker } A$.

Fantappié moment matrices—questions

Problem

How can we be sure that we found the generator(s) of the kernel, by looking at minors of A ?

Fantappié moment matrices—questions

Problem

How can we be sure that we found the generator(s) of the kernel, by looking at minors of A ?

Problem

How about nonlinear relations between moments? Can we find them? Can we use them?

Fantappié moment matrices—questions

Problem

How can we be sure that we found the generator(s) of the kernel, by looking at minors of A ?

Problem

How about nonlinear relations between moments? Can we find them? Can we use them?

Problem

Relate A and the “usual” moment matrices.

IMS Nov 2013/Jan 2014—announcement

A program on inverse moment problems has been announced:
<http://web.spms.ntu.edu.sg/~dima/IMS2013/>

IMS Nov 2013/Jan 2014—announcement

A program on inverse moment problems has been announced:

<http://web.spms.ntu.edu.sg/~dima/IMS2013/>

In particular a range of topics related to the present talk will be covered.
