What does "Q-complete" mean here?

Q-reduction and Q-complete sets

A is Q-reducible to B, $A \leq_Q B$, if there exists a computable function f with

 $x \in A \Leftrightarrow W_{f(x)} \subseteq B.$

(ロ)、(型)、(E)、(E)、 E) の(の)

Q-reduction and Q-complete sets

A is Q-reducible to B, $A \leq_Q B$, if there exists a computable function f with

 $x \in A \iff W_{f(x)} \subseteq B.$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- reflexive and transitive
- $\blacktriangleright \omega$, forget it.
- If $A \leq_Q B$ and B is a \prod_n set, then so is A.
- There exists a least Q-degree, i.e. the degree of Π_1 sets.

- $A \leq_Q K$ if and only if A is Π_2 .
- ▶ When A, B are both c.e. sets, $A \leq_Q B$ implies $A \leq_T B$.

So, on c.e. sets, Q-reduction is strictly stronger than Turing reduction.

▶ When A, B are both c.e., we can require f satisfying W_{f(x)} finite for each x.

- $A \leq_Q K$ if and only if A is Π_2 .
- ▶ When A, B are both c.e. sets, $A \leq_Q B$ implies $A \leq_T B$.

So, on c.e. sets, Q-reduction is strictly stronger than Turing reduction.

• When A, B are both c.e., we can require f satisfying $W_{f(x)}$ finite for each x.

A set A is Q-complete if it is r.e. and $K \leq_Q A$.

- $A \leq_Q K$ if and only if A is Π_2 .
- ▶ When A, B are both c.e. sets, $A \leq_Q B$ implies $A \leq_T B$.

So, on c.e. sets, Q-reduction is strictly stronger than Turing reduction.

- ▶ When A, B are both c.e., we can require f satisfying W_{f(x)} finite for each x.
- A set A is Q-complete if it is r.e. and $K \leq_Q A$.
 - ► Hyperhypersimple sets are not *Q*-complete. (Soloviev, 1974)

Semirecursive sets

A set ${\cal A}$ is semirecursive if there is a computable function f of two variables such that

(ロ)、(型)、(E)、(E)、 E) の(の)

1.
$$f(x, y) = x$$
 or $f(x, y) = y$,

2. f(x, y) is in A if either x or y is in A.

Semirecursive sets

A set A is semirecursive if there is a computable function f of two variables such that

1.
$$f(x, y) = x$$
 or $f(x, y) = y$,

This concept was proposed by Jockusch in 1968.

- Computable sets are semirecursive.
- > The complement of a semirecursive set is also semirecursive.
- ▶ If a simple set A is also semirecursive, then A is hypersimple.
- ▶ Every nonzero c.e. *T*-degree contains a semirecurisve hypersimple set.

Semirecursive sets

A set A is semirecursive if there is a computable function f of two variables such that

1.
$$f(x, y) = x$$
 or $f(x, y) = y$,

2.
$$f(x, y)$$
 is in A if either x or y is in A.

This concept was proposed by Jockusch in 1968.

- Computable sets are semirecursive.
- > The complement of a semirecursive set is also semirecursive.
- ▶ If a simple set A is also semirecursive, then A is hypersimple.
- ▶ Every nonzero c.e. *T*-degree contains a semirecurisve hypersimple set.

Theorem [Marchenkov 1976]

If a c.e. set A is semirecursive and not Q-complete, then A is not T-complete.

So, try to find a semirecursive, hyperhypersimple set, whose existence will provide a solution to Post's problem.

So, try to find a semirecursive, hyperhypersimple set, whose existence will provide a solution to Post's problem.

(ロ)、(型)、(E)、(E)、 E) の(の)

Theorem [Martin 1976]

No hyperhypersimple set is semirecursive.

Ershov's approach

Ershov's definition

- 1. An equivalence relation η is positive if η is c.e.
- 2. A set A is η -closed if it consists of equivalence classes w.r.t. η .
- 3. The η -closure $[A]_{\eta}$ is the smallest η -closed set containing A.
- 4. An η -closed set A is η -finite or η -infinite, if it consists of finite or infinite number of equivalence classes of A.
- 5. η -simple, η -hypersimple, η -hyperhypersimple sets.
- 6. η -hyperhypersimple sets are not *Q*-complete. (Marchenkov 1976)
- 7. There exists an incomputable, semirecursive, η -hyperhypersimple c.e. set.

Ershov's approach

Ershov's definition

- 1. An equivalence relation η is positive if η is c.e.
- 2. A set A is η -closed if it consists of equivalence classes w.r.t. η .
- 3. The η -closure $[A]_{\eta}$ is the smallest η -closed set containing A.
- 4. An η -closed set A is η -finite or η -infinite, if it consists of finite or infinite number of equivalence classes of A.
- 5. η -simple, η -hypersimple, η -hyperhypersimple sets.
- 6. η -hyperhypersimple sets are not Q-complete. (Marchenkov 1976)
- 7. There exists an incomputable, semirecursive, η -hyperhypersimple c.e. set.

This provides a solution to Post's problem.

Ershov's approach

Ershov's definition

- 1. An equivalence relation η is positive if η is c.e.
- 2. A set A is η -closed if it consists of equivalence classes w.r.t. η .
- 3. The η -closure $[A]_{\eta}$ is the smallest η -closed set containing A.
