#### Riemann's Rearrangement Theorem

Suppose  $\sum a_n$  is conditionally convergent and  $r \in \mathbb{R} \cup \{+\infty, -\infty\}$ . Then there is a rearrangement  $\pi \in \text{Sym}(\omega)$  such that  $\sum a_{\pi(n)} = r$ .

#### Riemann's Rearrangement Theorem

Suppose  $\sum a_n$  is conditionally convergent and  $r \in \mathbb{R} \cup \{+\infty, -\infty\}$ . Then there is a rearrangement  $\pi \in \text{Sym}(\omega)$  such that  $\sum a_{\pi(n)} = r$ .

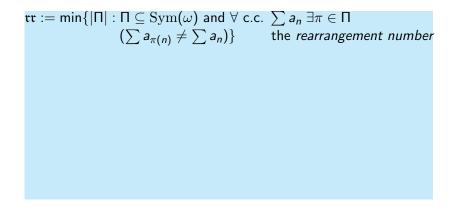

Also there is  $\pi \in \text{Sym}(\omega)$  such that  $\sum a_{\pi(n)}$  diverges by oscillation. ( $\liminf_k \sum_{0}^k a_{\pi(n)} < \limsup_k \sum_{0}^k a_{\pi(n)}$ ) How many permutations do we need such that for every conditionally convergent series  $\sum a_n$  there is a permutation  $\pi$  in our family such that  $\sum a_{\pi(n)}$  no longer converges to the same limit?

・同・ ・ヨ・ ・ヨ・

How many permutations do we need such that for every conditionally convergent series  $\sum a_n$  there is a permutation  $\pi$  in our family such that  $\sum a_{\pi(n)}$  no longer converges to the same limit?

What does it mean for real to compute a conditionally convergent series  $\sum a_n$  of rationals such that for all computable permutations  $\pi$ ,  $\sum a_{\pi(n)} = \sum a_n$ ?

Theorem 5  $cov(null) \leq rr$ 

Rademacher's Lemma

Let  $(c_n : n \in \omega)$  be a sequence of reals. Set

$$A = \{f \in 2^{\omega} : \sum_{n} (-1)^{f(n)} c_n \text{ converges}\}$$

Then

$$\mu(A) = \begin{cases} 1 & \text{if } \sum_{n} c_{n}^{2} \text{ converges} \\ 0 & \text{otherwise} \end{cases}$$

3

SQA

Theorem 5 cov(null) < rr

Π family of permutations, |Π| < cov(null), id ∈ Π. So  $\bigcup_{\pi ∈ Π} B_{\pi} ≠ 2^{\omega}$ . Let  $f ∈ 2^{\omega} \setminus \bigcup_{\pi ∈ Π} B_{\pi}$ .

<ロト <回ト < 回ト < 回ト < 回ト -

3

SQA

Theorem 5 cov(null) < rr

Proof: 
$$\pi \in \text{Sym}(\omega)$$
.  $\sum \frac{1}{\pi(n)^2}$  convergent.  
 $A_{\pi} = \{f \in 2^{\omega} : \sum_{n} \frac{(-1)^{f(n)}}{\pi(n)} \text{ diverges}\}$  null by Rademacher.  
 $B_{\pi} = \{f \in 2^{\omega} : \sum_{n} \frac{(-1)^{f(\pi(n))}}{\pi(n)} \text{ diverges}\}$  null  
(measure-preserving bijection).

 $\begin{array}{l} \Pi \text{ family of permutations, } |\Pi| < \operatorname{cov(null), } id \in \Pi. \\ \text{So } \bigcup_{\pi \in \Pi} B_{\pi} \neq 2^{\omega}. \text{ Let } f \in 2^{\omega} \setminus \bigcup_{\pi \in \Pi} B_{\pi}. \\ \text{Hence } \sum \frac{(-1)^{f(n)}}{n} \text{ c.c. and } \sum_{n} \frac{(-1)^{f(\pi(n))}}{\pi(n)} \text{ converges for all } \pi \in \Pi. \end{array}$ 

イロト 不得 とうせい かほとう ほ

#### rr versus cov(null), 2

Theorem 5 cov(null) < rr

Proof: 
$$\pi \in \text{Sym}(\omega)$$
.  $\sum \frac{1}{\pi(n)^2}$  convergent.  
 $A_{\pi} = \{f \in 2^{\omega} : \sum_{n} \frac{(-1)^{f(n)}}{\pi(n)} \text{ diverges}\} \text{ null by Rademacher.}$   
 $B_{\pi} = \{f \in 2^{\omega} : \sum_{n} \frac{(-1)^{f(\pi(n))}}{\pi(n)} \text{ diverges}\} \text{ null}$   
(measure-preserving bijection).

 $\Pi \text{ family of permutations, } |\Pi| < \operatorname{cov}(\operatorname{null}), \ id \in \Pi.$ So  $\bigcup_{\pi \in \Pi} B_{\pi} \neq 2^{\omega}$ . Let  $f \in 2^{\omega} \setminus \bigcup_{\pi \in \Pi} B_{\pi}$ . Hence  $\sum \frac{(-1)^{f(n)}}{n}$  c.c. and  $\sum_{n} \frac{(-1)^{f(\pi(n))}}{\pi(n)}$  converges for all  $\pi \in \Pi$ . Thus  $\mathfrak{rr}_{o} \geq \operatorname{cov}(\operatorname{null})$ . By Theorem 1,  $\mathfrak{rr} \geq \operatorname{cov}(\operatorname{null})$ . Done!
