Kalman Filter

Sequential Optimization Perspective

Predict:
$$\hat{m}_{n+1} = Mm_n$$
, $n \in \mathbb{Z}^+$
Model/Data Compromise: $J_n(m) = \frac{1}{2}|m - \hat{m}_{n+1}|^2_{\hat{c}_{n+1}} + \frac{1}{2}|y_{n+1} - Hm|^2_{\Gamma}$
Optimize: $m_{n+1} = \operatorname{argmin}_m J_n(m)$.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

•
$$|\cdot|_A = |A^{-\frac{1}{2}} \cdot |$$
 for $A > 0$.

- Updating \hat{C}_{n+1} is expensive: $\mathcal{O}(d^2)$ storage.
- d the state space dimension.

Ensemble Kalman Filter

State Space Model

Dynamics Model: $v_{n+1} = \Psi(v_n) + \xi_n$, $n \in \mathbb{Z}^+$ Data Model: $y_{n+1} = Hv_{n+1} + \eta_{n+1}$, $n \in \mathbb{Z}^+$ Probabilistic Structure: $v_0 \sim N(m_0, C_0)$, $\xi_n \sim N(0, \Sigma)$, $\eta_j \sim N(0, \Gamma)$ Probabilistic Structure: $v_0 \perp \{\xi_n\} \perp \{\eta_n\}$ independent

- Motivated by extended Kalman filter; see [2].

- ▶ J. Geophysical Research 99(1994).
- Original paper in ocean dynamics.
- Used in weather forecasting centres worldwide.

•
$$\{u_n^{(k)}\}_{k=1}^K \mapsto \{u_{n+1}^{(k)}\}_{k=1}^K$$

Ensemble Kalman Filter

Sequential Optimization Perspective

$$\begin{array}{ll} \mathsf{Predict:} & \hat{v}_{n+1}^{(k)} = \Psi(v_n^{(k)}) + \xi_n^{(k)}, & n \in \mathbb{Z}^+\\ \mathsf{Model/Data Compromise:} & J_n^{(k)}(v) = \frac{1}{2} |v - \hat{v}_{n+1}^{(k)}|_{\hat{\mathcal{C}}_{n+1}}^2 + \frac{1}{2} |y_{n+1}^{(k)} - Hv|_{\Gamma}^2\\ \mathsf{Optimize:} & v_{n+1} = \operatorname{argmin}_v J_n^{(k)}(v). \end{array}$$

- \hat{C}_{n+1} is empirical covariance of the $\{\hat{v}_{n+1}^{(k)}\}$.
- Updating \hat{C}_n requires only $\mathcal{O}(Kd)$ storage.
- The simplicity and cost of the EnKF makes its applicable!

Inverse Problems

► Aim: The recovery of an unknown *u* ∈ X from perturbed noisy measurements of data *y* ∈ Y where

$$\mathbf{y} = \mathcal{G}(\mathbf{u}) + \eta, \quad \eta \sim \mathcal{N}(\mathbf{0}, \mathbf{\Gamma}) \tag{1}$$

Bayesian approach: Unknown is now a probabilistic distribution of the random variable u|y using Bayes' formula

 $\mathbb{P}(\boldsymbol{u}|\boldsymbol{y}) \propto \mathbb{P}(\boldsymbol{y}|\boldsymbol{u})\mathbb{P}(\boldsymbol{u}).$

• We consider a posterior measure μ^{γ} described through Radon-Nikodym derivative

$$\frac{d\mu^{y}}{d\mu_{0}}(\boldsymbol{u}) = \frac{1}{Z} \exp(-\Phi(\boldsymbol{u};\boldsymbol{y})),$$

with misfit functional

$$\Phi(\boldsymbol{u};\boldsymbol{y}) = \frac{1}{2}|\boldsymbol{y} - \mathcal{G}(\boldsymbol{u})|_{\Gamma}^{2}.$$

Ensemble Kalman Inversion (EKI)

Problem Statement

Find u from y where $\mathcal{G} : \mathcal{X} \mapsto \mathcal{Y}$, η is noise and

 $\mathbf{y} = \mathcal{G}(\mathbf{u}) + \eta.$

- Origins in data assimilation applications. (Oliver et al. [2008]).
- Application to PDE-constrained inverse problems. (Iglesias et al. [2013]).
- Noise controlled system, i.e.
- Requires only black box forward model G.
- Very limited theoretical understanding.

Lemma

For all $n \in \mathbb{Z}^+, j \in \{1, \dots, J\}$, $u_n^{(j)} \in \text{span}(\{u_0^{(j)}\}_{j=1}^J)$.

i.e. the updated ensemble $\{u_n^{(j)}\}_{j=1}^J$ spanned by the linear span of the initial ensemble $\{u_0^{(j)}\}_{j=1}^J$. Limitation

The Basic Algorithm

- ▶ Initial Ensemble $\{u_0^{(j)}\}_{j=1}^J \subset X$.
- Ensemble First and Second Order Moments

Means:

$$\overline{u}_n = rac{1}{J}\sum_{j=1}^J u_n^{(j)}, \quad \overline{w}_n = rac{1}{J}\sum_{j=1}^J \mathcal{G}(u_n^{(j)}).$$

Covariances:

$$C_n^{ww} = \frac{1}{J-1} \sum_{j=1}^J (\mathcal{G}(\boldsymbol{u}_n^{(j)}) - \overline{w}_n) \otimes (\mathcal{G}(\boldsymbol{u}_n^{(j)}) - \overline{w}_n),$$
$$C_n^{uw} = \frac{1}{J-1} \sum_{j=1}^J (\boldsymbol{u}_n^{(j)} - \overline{u}_n) \otimes (\mathcal{G}(\boldsymbol{u}_n^{(j)}) - \overline{w}_n).$$

Update step

 $n\mapsto n+1$:

$$u_{n+1}^{(j)} = u_n^{(j)} + C_n^{uw} (C_n^{ww} + \Gamma)^{-1} (y^{(j)} - \mathcal{G}(u_n^{(j)}))$$

Whittle-Matérn Initial Ensembles

- Create initial ensemble of functions via Gaussian random fields.
- Common choice: Whittle-Matérn family

$$c_{\sigma,\nu,\tau}(x,x') := \sigma^2 \frac{2^{1-\nu}}{\Gamma(\nu)} \big(\tau |x-x'|\big)^{\nu} \mathcal{K}_{\nu}\big(\tau |x-x'|\big).$$

- Smoothness parameter: $\nu \in \mathbb{R}^+$.
- Inverse length-scale parameter: $\tau \in \mathbb{R}^+$.
- Amplitude parameter: $\sigma \in \mathbb{R}$.
- Corresponding covariance operator

$$\mathcal{C}_{\sigma,\nu,\tau} \propto \sigma^2 \tau^{2\nu} (\tau^2 I - \triangle)^{-\nu - \frac{d}{2}}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

$$\triangleright \ \nu = \alpha - \frac{d}{2}.$$

• Hierarchical: invert for parameters such as σ, ν, τ as well as field itself.

Centred vs Non-centred

- Define $\theta = (\alpha, \tau)$.
- Generate samples v by solving the SPDE

$$(\tau^2 I - \triangle)^{\frac{\alpha}{2}} v = \sigma \tau^{\alpha - \frac{d}{2}} \xi,$$

where $\xi \sim N(0, I)$ is white noise. $u = T(\xi, \theta)$. See [4] Lindgren et al (2011).

• Hierarchical: invert for parameters θ as well as field v.

- Centred approach:
 - view (v, θ) as unknowns;
 - initial ensemble samples $\mathbb{P}(v|\theta)\mathbb{P}(\theta)$;
 - $y = \mathcal{G}(v) + \eta$.
- Non-centred approach:
 - view (ξ, θ) as unknowns;
 - initial ensemble samples $\mathbb{P}(\xi)\mathbb{P}(\theta)$;
 - $y = \mathcal{G}(T(\xi,\theta)) + \eta.$

See [11] Papaspiliopoulos et al (2007).

Electrical Impedance Tomography (EIT)

Forward Problem

Given $(\kappa, I) \in L^{\infty}(D; \mathbb{R}^+) \times \mathbb{R}^{m_e}$ find $(\nu, V) \in H^1(D) \times \mathbb{R}^{m_e}$:

$$\begin{aligned} -\nabla \cdot (\kappa \nabla \nu) &= 0 \quad \in \quad D, \\ \nu + z_l \kappa \nabla \nu \cdot n &= V_l \quad \in \quad e_l, \quad l = 1, \dots, m_e, \\ \nabla \nu \cdot n &= 0 \quad \in \quad \partial D \setminus \cup_{l=1}^{m_e} e_l, \\ \int \kappa \nabla \nu \cdot n \, ds &= I_l \quad \in \quad e_l, \quad l = 1, \dots, m_e. \end{aligned}$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Ohms Law: $V = R(\kappa) \times I$

Inverse Problem

Given $\kappa = \exp(u)$ and a set of *m* measurements of voltage V_l , $\mathcal{G}(u) \in \mathbb{R}^{m_e \times m}$ find *u* from *y* where:

$$y = \mathcal{G}(u) + \eta, \quad \eta \sim \mathsf{N}(0, \Gamma).$$

- True Conductivity.
- level set formulation.
- Hyperparameters uniformly chosen: $\tau, \alpha \sim \mathcal{U}[\cdot, \cdot]$.

- Non-Hierarchical.
- Reconstructed level set function at three different iteration steps.
- Reconstructed conductivity at three different iteration steps.

- Centred Hierarchical.
- Reconstructed level set function at three different iteration steps.
- Reconstructed conductivity at three different iteration steps.

- Non-centred Hierarchical.
- Reconstructed level set function at three different iteration steps.
- Reconstructed conductivity at three different iteration steps.

Non-Stationary Hyperparameters

- Treating the length scale $\tau^{-1} = \ell$ as a field.
- To ensure positivity write

$$\ell(x) := \exp(\nu(x)).$$

• Now we generate samples ξ from the SPDE

$$(1 - \boldsymbol{\ell}(\boldsymbol{x}; \boldsymbol{v})^2 \boldsymbol{\Delta})^{\alpha/2} \boldsymbol{u} = \sigma \sqrt{\boldsymbol{\ell}(\boldsymbol{x}; \boldsymbol{v})^d} \boldsymbol{\xi}.$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Centred approach: view (u, v) as unknown.
- Non-centred approach: view (ξ, v) as unknown.
- Gaussian and Cauchy (next weeks talk) length scale.
- Details found in Chada et al. [2018].

Continuum limits

Non-hierarchical:

$$\mathbf{u}_{n+1}^{(j)} = \mathbf{u}_{n}^{(j)} + C_{n}^{uw} (C_{n}^{ww} + h^{-1}\Gamma)^{-1} (y^{(j)} - \mathcal{G}(\mathbf{u}_{n}^{(j)}))$$

• Hierarchical: through Euler-Maruyama discretization we have $(h \rightarrow 0)$

$$\frac{d\xi^{(j)}}{dt} = \frac{1}{J} \sum_{k=1}^{J} \left\langle \mathcal{G}^{\mathsf{T}}(\boldsymbol{\xi}^{(k)}, \boldsymbol{\theta}^{(k)}) - \overline{\mathcal{G}^{\mathsf{T}}}, \boldsymbol{y} - \mathcal{G}^{\mathsf{T}}(\boldsymbol{\xi}^{(j)}, \boldsymbol{\theta}^{(j)}) + \sqrt{\Gamma} \frac{d\mathcal{W}^{(j)}}{dt} \right\rangle_{\Gamma}(\boldsymbol{\xi}^{(k)} - \overline{\boldsymbol{\xi}})$$

• In the linear $\mathcal{G}^{T}(\xi, \theta) = Au$, noise-free case we have

$$\frac{d\boldsymbol{u}^{(k)}}{dt} = -C\nabla\Phi_{\boldsymbol{u}}(\boldsymbol{u}^{(k)}),$$

$$\boldsymbol{U} = \frac{1}{K}\sum_{k=1}^{K} (\boldsymbol{u}^{(k)} - \overline{\boldsymbol{u}}) \otimes (\boldsymbol{u}^{(k)} - \overline{\boldsymbol{u}}).$$
(2)

Theorem

For every $(n, j) \in \mathbb{N} \times \{1, \dots, J\}$ we have $\xi_{n+1}^{(j)}$, $\theta_{n+1}^{(j)} \in \mathcal{A}$ and ξ_{n+1} , $\theta_{n+1} \in \mathcal{A}$ hence $u_{n+1} \notin T\mathcal{A}$, where $T\mathcal{A}$ is the space containing the transformed ensemble of particles.

Box-constrained optimization

- Issue: No guarantee the ensemble will stay within a region of interest.
- Motivates box-constrained optimization of the ensemble.
- Let $\mathcal{B} = [a_1, b_1] \times \cdots \times [a_n, b_n]$ denote a box, where we assume that $\mathcal{X} = \mathbb{R}^n$, with a general projection as $\mathcal{P}_{\mathcal{B}} : \mathbb{R}^n \to \mathcal{B}$.

$$(\mathcal{P}(x))_i = \begin{cases} a_i, & \text{if } x_i < a_i \\ x_i, & \text{if } x_i \in [a_i, b_i], , \\ b_i, & \text{if } x_i > b_i, \end{cases}$$
 $i = 1, ..., n,$

We consider the ensemble square roof filter (ESRF)

$$\begin{cases} \tilde{u}_{n+1,\mathcal{P}}^{(j)} = u_{n,\mathcal{P}}^{(j)} + C_{n,\mathcal{P}}^{up} (C_{n,\mathcal{P}}^{pp} + h^{-1}\Gamma)^{-1} (y - \frac{1}{2}\mathcal{G}(u_{n,\mathcal{P}}^{(j)}) - \frac{1}{2}\bar{\mathcal{G}}_{\mathcal{P}}), \\ u_{n+1,\mathcal{P}}^{(j)} = \mathcal{P}(\tilde{u}_{n+1,\mathcal{P}}^{(j)}). \end{cases}$$

• Corresponding limit as $h \rightarrow 0$

$$(u_{n+1}^{(j)})_i - (u_n^{(j)})_i = \mathcal{P}\left([\mathcal{P}(\tilde{u}_n^{(j)})]_i + h\left[C_{n,\mathcal{P}}^{up}(hC_{n,\mathcal{P}}^{pp} + \Gamma)^{-1}(y - \frac{1}{2}\mathcal{G}(\mathcal{P}(u_n^{(j)})) - \frac{1}{2}\bar{\mathcal{G}}_{\mathcal{P}})\right]_i\right) - \mathcal{P}\left([\mathcal{P}(\tilde{u}_n^{(j)})]_i\right)$$

State in terms of directional derivatives

$$\lim_{h\to 0} \frac{(u_{n+1}^{(j)})_i - (u_n^{(j)})_i}{h} = \begin{cases} v_i & , (\tilde{u}_n^{(j)})_i \in (a_i, b_i) \\ 1_{[0,\infty)}(v_i)v_i & , (\tilde{u}_n^{(j)})_i \leq a_i \\ 1_{(-\infty,0]}(v_i)v_i & , (\tilde{u}_n^{(j)})_i \geq b_i. \end{cases}$$

We observe that

•
$$(\tilde{u}_n^{(j)})_i \in (a_i, b_i)$$
 if and only if $(u_n^{(j)})_i \in (a_i, b_i)_i$

• $(\tilde{u}_n^{(j)})_i \leq a_i$ if and only if $(u_n^{(j)})_i = a_i$,

•
$$(\tilde{u}_n^{(j)})_i \ge b_i$$
 if and only if $(u_n^{(j)})_i = b_i$.

Numerics (1D cont flow - elliptic PDE)

・ロト ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ 日 ・ ・ の へ ()・

Optimal transport

- Understand the EnKF through optimal transport (OT).
- Cheung, Cotter, Reich [2012, 2013].
- Arises through coupling of μ and ν .

Kantorovich problem

Given two distributions μ, ν and a set of all couplings $\mathcal{P}(\mu, \nu)$ with cost function $c : \mathcal{X} \times \mathcal{X} \to [0, \infty)$, the OT problem seeks to minimize

$$\mathbb{E}_{\gamma}[c(u,v)]$$

over the set of couplings γ

$$\gamma^{\mathrm{OT}} := \mathsf{argmin}\big\{\gamma \mapsto \mathbb{E}_{\gamma}[\boldsymbol{c}(\boldsymbol{u},\boldsymbol{v})], \quad \gamma \in \mathcal{P}(\mu,\nu), \quad (\boldsymbol{u},\boldsymbol{v}) \sim \gamma\big\}$$

- Treat μ and ν as prior and posterior.
- Consider gradient flow structure.

Entropic regularization

Require regularization

$$u^{(\ell+1} := \operatorname{argmin}_{u \in \mathcal{X}} \mathcal{W}_{p}(u, u^{(\ell)})^{p} + \tau F(u).$$

• Know result: $\tau \rightarrow 0$, \implies Fokker-Planck equation.

 Consider a Lagrangian discretization (set of measures and their locations) over time

$$\mu_t := \frac{1}{N} \sum_{i=1}^N \delta_{\mathbf{x}_i}(t). \tag{3}$$

- equal-weight particle filter.
- Idea: μ_t ≡ μ → μ_{t+1} ≡ ν, i.e. represent (3) as an N coupled ODEs of particles X(t) = (x_i(t))_i.
- Hope: $X(t) = -\nabla \mathcal{F}(X(t))$ where $\mathcal{F}(X) = F(\frac{1}{n} \sum_{i=1}^{n} \delta_{x_i})$.

Gaussian mixture model

- μ, ν are assume Gaussian.
- Gradient flow evolution of Lagrangian discretization.

・ロト・日本・モト・モート ヨー うへで

Interested in stationary distribution.

Discussion

- The EnKF is a simple but highly applicable algorithm.
- > Applications: geosciences, NWP, oceanography, machine learning.

- Considered both inverse problems and optimal transport.
- Blends MC approaches with optimization techniques.
- Project-based optimization, for EKI and HEKI.
- Understanding the EnKF as an optimizer.
- Additional forms of regularization to be included!
- Applications to large-scale problems.
