July 10, 2018 IMS, NUS A social planner has an objective summarized by a social choice function (SCF) f : Θ → X.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

• A social planner has an objective summarized by a social choice function (SCF) $f: \Theta \to X$.

 An SCF is Nash implementable if there exists a mechanism/game-form that satisfies two requirements:

- A social planner has an objective summarized by a social choice function (SCF) $f: \Theta \to X$.
- An SCF is Nash implementable if there exists a mechanism/game-form that satisfies two requirements:
 - Existence: there always exists a good NE whose outcome is socially desirable;

- A social planner has an objective summarized by a social choice function (SCF) $f: \Theta \to X$.
- An SCF is Nash implementable if there exists a mechanism/game-form that satisfies two requirements:
 - Existence: there always exists a good NE whose outcome is socially desirable;

• Uniqueness: every NE results in the socially desirable outcome.

• Maskin proposes a monotonicity condition and shows that it is a necessary and almost sufficient condition for Nash implementation.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Maskin proposes a monotonicity condition and shows that it is a necessary and almost sufficient condition for Nash implementation.
- The sufficiency result has been criticized/improved on different aspects:

• Choose ε small so that all test allocations remain valid.

Choose D large so that transfers dominate:

Transfer to agents	$m_{i,j}^2 = m_{j,j}^2$	$m_{i,j}^2$;	$\neq m_{j,j}^2$
		$m_{i,j}^2 = m_j^1$	$m_{i,j}^2 eq m_j^1$
$\left(au_{i}\left(m ight)$, $ au_{j}\left(m ight) ight)$	(0, 0)	(D, -D)	(-D, -D)

• *j*'s 1st report is truthful \Rightarrow *i*'s 2nd report is truthful:

Transfer to <i>i</i>	$\left(m_{j}^{1},m_{j,j}^{2} ight) =\left(heta_{j}, heta_{j} ight)$	$\left(\left(m_{j}^{1},m_{j,j}^{2} ight) =\left(heta_{j}, heta_{j}^{\prime} ight) ight)$
$m_{i,j}^2 = heta_j$	0	D
$m_{i,j}^2 eq heta_j$	- <i>D</i>	0 or <i>-D</i>

Agent 2	θ_2	γ_1,γ_2

- This contradicts contagion of truth.
- Similarly, it cannot be both agents choose a deterministic yet inconsistent 2nd report.
- Similarly, it cannot be only one agent who randomizes his 2nd report.

• By consistency, there can only be a unanimous 2nd report

	2st report	3nd report
Agent 1	$ ilde{ heta}_1$, $ ilde{ heta}_2$	δ_1
Agent 2	$ ilde{ heta}_1$, $ ilde{ heta}_2$	δ_2

(ロ)、(型)、(E)、(E)、 E) の(の)

• By consistency, there can only be a unanimous 2nd report

	2st report	3nd report
Agent 1	$ ilde{ heta}_1$, $ ilde{ heta}_2$	δ_1
Agent 2	$ ilde{ heta}_1$, $ ilde{ heta}_2$	δ_2

We argue that

$$\mathcal{SL}_i(f(ilde{ heta}), ilde{ heta}_i)\cap\mathcal{SU}_i(f(ilde{ heta}), heta_i)=arnothing$$
 for every i

which implies

$$\mathcal{SL}_i(f(ilde{ heta}), ilde{ heta}_i)\cap\mathcal{U}_i(f(ilde{ heta}), heta_i)=arnothing$$
 for every i

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

which further implies no challenge.

• Suppose to the contrary that

 $\mathcal{SL}_1(f(\tilde{ heta}), \tilde{ heta}_1) \cap \mathcal{SU}_1(f(\tilde{ heta}), heta_1)
eq arnothing$

• Suppose to the contrary that

 $\mathcal{SL}_1(f(\tilde{\theta}), \tilde{ heta}_1) \cap \mathcal{SU}_1(f(\tilde{\theta}), heta_1) \neq \varnothing$

• When 1 checks 2, $\tilde{\theta}$ will also be challenged by every 3rd report δ_1 ,

 $\mathcal{SL}_1(f(\tilde{ heta}), \tilde{ heta}_1) \cap \mathcal{SU}_1(f(\tilde{ heta}), \delta_1) \neq arnothing$

• Suppose to the contrary that

$$\mathcal{SL}_1(f(\tilde{ heta}), \tilde{ heta}_1) \cap \mathcal{SU}_1(f(\tilde{ heta}), heta_1) \neq \varnothing$$

• When 1 checks 2, $\tilde{\theta}$ will also be challenged by every 3rd report δ_1 ,

$$\mathcal{SL}_1(f(\tilde{ heta}), \tilde{ heta}_1) \cap \mathcal{SU}_1(f(\tilde{ heta}), \delta_1) \neq arnothing$$

• Dictator lottery happens with probability 1. Then, contagion of truth implies

$$\tilde{\theta} = \theta$$
.
